**ⓘCAUTION: Electrostatic Sensitive Device. Observe precautions for handling!**

1. The frequency $f_C$ is the frequency of minimum IL with the resonator in the specified test fixture in a 50Ω test system with VSWR ≤ 1.2:1. Typically, $f_{OSCILLATOR}$ or $f_{TRANSMITTER}$ is less than the resonator $f_C$.
2. Unless noted otherwise, case temperature $T_C$ = +25°C±2°C.
3. Frequency aging is the change in $f_C$ with time and is specified at +65°C or less. Aging may exceed the specification for prolonged temperatures above +65°C. Typically, aging is greatest the first year after manufacture, decreasing in subsequent years.
4. Turnover temperature, $T_0$, is the temperature of maximum (or turnover) frequency, $f_0$. The nominal frequency at any case temperature, $T_C$, may be calculated from: $f = f_0 [1 - FTC (T_0 - T_C)^2]$. Typically, *oscillator* $T_0$ is 20° less than the specified *resonator* $T_0$.
5. This equivalent RLC model approximates resonator performance near the resonant frequency and is provided for reference only. The capacitance $C_0$ is the measured static (nonmotional) capacitance between either Pin 1 and ground or Pin 2 and ground. The measurement includes case parasitic capacitance.
6. Derived mathematically from one or more of the following directly measured parameters: $f_C$, IL, 3 dB bandwidth, $f_C$ versus $T_C$, and $C_0$.
7. The specifications of this device are based on the test circuit shown above and subject to change or obsolescence without notice.
8. Typically, equipment utilizing this device requires emissions testing and government approval, which is the responsibility of the equipment manufacturer.
9. Our liability is only assumed for the Surface Acoustic Wave (SAW) component(s) per se, not for applications, processes and circuits implemented within components or assemblies.
